Section 1

Battery Sizing

Sizing Marathon Batteries for a Constant Current Load:

In order to correctly size any battery for a constant current load, the following information will be required:

1. Required load in amperes.
2. Required back-up time.
3. Final system voltage.
4. Nominal system operating voltage.
5. Any correction factors that will affect the battery sizing.

Example: A nominal 48 volt (24 cell) telecommunications system requires 20 amps constant current and will operate satisfactorily down to a minimum of 42 volts. Calculate the battery required for 4 hours standby duration on the basis of

- a) 25°C operating temperature
- b) 0°C operating temperature

Step 1 - Load

Total battery duty = 20 amps

Step 2 – Calculating End Voltage per Cell (VPC)

Minimum allowable volts per cell = 42 volts/24 cells = 1.75vpc

Hence cell performance requirement is 20 amperes to 1.75 vpc.

Step 3 – Determination of appropriate cell size

Refer to the Marathon performance specification table for 1.75 vpc end voltage @ 25°C. (Table A)

a) @ 25°C, the required battery type would be an M12V90 (If load required falls between cell sizes, always select the larger cell. This will ensure that the battery is not undersized). Conclusion: Use 4 M12V90 Batteries.

b) @ 0°C, temperature correction for battery performance is required (See Table C, pg. 4). In this case, a 4 hour backup time at 0°C will require a 0.82 temperature correction factor. Multiplying the 25°C values in TABLE A by 0.82 yields temperature corrected cell capacities @ 0°C (Table B). • For the given 20 ampere load @ 0°C, the appropriate cell size would now be M6V190(F).

Conclusion: Use eight (8) M6V190(F) batteries connected in series.

Table A

Model Number	Hours		
	5	4	3
M12V40/M12V40F	7.6	9.3	11.9
M12V70/M12V70F	13.4	16.5	21.2
M12V90/M12V90F	16.7	20.2	25.9
M6V190/M6V190F	35.9	43.7	56.0

Table B

Temp. Corrected Cell Capacities for 0°C			
Model Number	Hours		
	5	4	3
M12V40/M12V40F	6.2	7.6	9.7
M12V70/M12V70F	11.0	13.3	16.9
M12V90/M12V90F	13.7	16.6	21.2
M6V190/M6V190F	29.4	35.8	46.6

Helpful Data for Constant Current Sizing

Table C

Discharge Time	Temperature Correction Factor					
	0°C	5°C	10°C	15°C	20°C	25°C
5 min to 59 min	0.74	0.80	0.86	0.91	0.96	1
60 Minutes and up	0.82	0.86	0.90	0.93	0.97	1

Note: temperature correction for capacity is not used above 25°C

- **To convert from degrees Fahrenheit to degrees Celsius:**

$$^{\circ}\text{C} = \frac{(^{\circ}\text{F}-32) \times 5}{9}$$

- **IEEE compliance with respect to Design Margins and Aging Factors**

Sizing batteries per IEEE 485 recommends the use of both an aging factor and a design margin. The recommended aging factor is 1.25 and the recommended design margin is 1.10.

Therefore, if a battery was required to be sized for a 20 ampere load in accordance with IEEE Standard 485, the load would be modified as follows:

Given load = 20 Amps

Aging Factor = 1.25

Design Margin = 1.10

Corrected Load = 20 amps X 1.25 X 1.10

Corrected Load = 27.5 amperes

- Therefore, to meet IEEE standard 485 specifications, the battery must be sized to 27.5 amps, NOT 20 amps.

• Series/Parallel Strings

Marathon/Sprinter batteries are available in either 12 volt or 6 volt units. When connected in series (positive post of one battery to the negative post of the next), the battery string voltage will increase by the voltage of the battery added. The amp-hour rating, however, will remain the same.

Series connected example:

Two Marathon M12V90 batteries (each battery is a 12 volt, 90 amp-hour battery) connected in series (positive post of battery 1 to negative post of battery 2) will provide a total nominal string voltage of 24 volts. The total string amp-hour capacity will remain 90 amp-hours.

Parallel connected example:

The same two M12V90 batteries connected in parallel (positive post of battery 1 to positive post of battery 2 and negative post of battery 1 connected to negative post of battery 2) will deliver a total nominal string voltage of 12 volts. The total string amp-hour capacity, however, will be 180 amp-hours.

Sizing Sprinter Batteries for a Constant Power Load

To size any battery for a constant power load, the load must be expressed as Watts DC. The data required for correctly sizing the cells is as follows:

1. Load given in either kilowatts or watts
2. System limits such as maximum and minimum voltages.
3. Discharge duration.

Example: Sizing a Sprinter battery for a 3kW load with the following system restrictions:

Required back-up time: 60 minutes

Maximum system voltage: 58 volts

Minimum system voltage: 41.5 volts

Operating Temperature: a) 25°C

b) 5°C

Step 1 - Calculating the DC Load

$$W = kW \times 1,000$$

$$W = 3kW \times 1,000 = 3,000 \text{ watts}$$

Step 2 - Determining the required number of cells

$$\text{Number of cells} = \frac{\text{Maximum system Voltage}}{\text{Equalize voltage per cell}}$$

(typical equalize voltage per cell for Sprinter Batteries is 2.35 volts)

$$\begin{aligned} N (\text{Number of cells}) &= \frac{58 \text{ volts}}{2.35 \text{ vpc}} \\ &= 24.68 \rightarrow 24 \text{ cells} \end{aligned}$$

Step 3 – Determining the End voltage

$$\begin{aligned} \text{End Voltage} &= \frac{\text{Minimum System Voltage}}{N} \\ &= \frac{41.5 \text{ volts}}{24 \text{ cells}} \\ &= 1.73 \text{ volts/cell} \rightarrow 1.75 \text{ vpc} \end{aligned}$$

Note: 1.73 volts per cell was raised to 1.75 volts per cell to ensure that the minimum system voltage is never reached.

Step 4 – determining the required load per cell

$$\begin{aligned} WPC &= \frac{W}{N} \\ &= \frac{3,000 \text{ watts}}{24 \text{ cells}} \\ &= 125 \text{ watts/cell} \end{aligned}$$

Step 5a – Selecting Appropriate Cell Size for an operating Temperature of 25°C

By referring to the Sprinter constant power table for a cell end voltage of 1.75 vpc at 25°C (Table D) and reading down the 60 minute column, it can be found that the Sprinter S12V370(F) will be required. This model will deliver 129 wpc where the actual system requirement is for 125 wpc.

Table D

Model Number	Minutes		
	45	60	75
S12V120/S12V120F	51	40	33
S12V170/S12V170F	73	58	48
S12V300/S12V300F	130	104	88
S12V370/S12V370F	163	129	107
S6V740/S6V740F	326	258	212

Step 5b – Selecting Appropriate Cell Size for an operating Temperature of 5°C

At 5°C, temperature correction for battery performance is required (See TABLE C, pg 4). In this case, a 60 minute backup time at 5°C will require a 0.86 temperature correction factor. Multiplying the 25°C values in TABLE D by 0.86 yields temperature corrected cell capacities @ 5°C (TABLE E).

Table E

Temp. Corrected Cell Capacities for 5°C			
Model Number	Minutes		
	45	60	75
S12V120/S12V120F	43	34	28
S12V170/S12V170F	62	49	41
S12V300/S12V300F	111	89	75
S12V370/S12V370F	140	110	92
S6V740/S6V740F	280	221	182

Conclusion:

- For the given 125 WPC load

The appropriate temperature corrected cell size would be S6V740(F).

Therefore, use *eight (8)* S6V740(F) batteries connected in series.

Helpful Data for Constant Power Sizing

- **To convert from degrees**

Fahrenheit to degrees Celsius:

$$^{\circ}\text{C} = \frac{(^{\circ}\text{F} - 32) \times 5}{9}$$

- **To convert from KVA to KWB:**

$$\text{KWB} = \frac{\text{KVA} \times \text{P.F.}}{e}$$

Where: KVA = Kilovolt Amps

 KWB = Kilowatt Battery

 P.F. = Power Factor (if not listed use 0.8)

 e = Efficiency (if not listed use 0.9)

ex. The given power requirements are listed as 11.25KVA. What is the corresponding Battery load?

As the power factor and efficiency are not listed, 0.8 and 0.9 will be used respectively.

$$\text{KWB} = \frac{11.25 \times 0.8}{0.9} = 10 \text{ KWB}$$

- **IEEE compliance with respect to Design Margins and Aging Factors**

Sizing batteries per IEEE 485 recommends the use of both an aging factor and a design margin. The recommended aging factor is 1.25 and the recommended design factor is 1.10.

Therefore, if a battery was required to be sized for the above 10KWB load in accordance with IEEE Standard 485, the load would be modified as follows:

Given load = 10KWB

Aging Factor = 1.25

Design Margin = 1.10

Corrected Load = 10KWB X 1.25 X 1.10

Corrected Load = 13.75 KWB

Therefore, to meet IEEE standard 485 specifications, the battery must be sized to 13.75KWB, NOT 10KWB.

To specify this option, change "23F" to "19F" in the system part number.

If required, order 19" Relay Rack Equipment Stand, (part # S07-420399-001), separately.

Section 4

Bookshelf Racking & Accessories

System Configuration Bookshelf Racking

This section will take you through the process of developing a battery system utilizing a bookshelf rack. The batteries used will be the M12V90 model type that was developed in example (a) of Section 1.

Step 1. Determine Rack Configuration.

As calculated in Section I, the number of M12V90 battery units required is 4. The next step is to determine the rack style. Referencing the “MAX UNITS” column of the “NON-SEISMIC & SEISMIC RACKS” table on page 22, the smallest compatible rack configuration is 1-Tier, 1 Row.

Step 2. Determine Rack Part Number

The next step is to identify the seismic requirements for the rack. A -Z0 suffix indicates Zone 0. A -Z4 suffix indicates Zone 1-4. For this example, a non-seismic, Zone 0 rack will be used. The corresponding rack part number for four (4) M12V90 battery units is:

GNB114S370Z0

Step 3. Determine Number of Connectors

The formula for number of connectors is:

$$\text{Connectors} = ((N/(\# \text{ tiers})) - 1) * (\# \text{ tiers})$$

For this example, the number of connectors required for 4 M12V90s would be:

$$\begin{aligned}\text{Connectors} &= ((4/(1)) - 1) * (1) \\ &= 3\end{aligned}$$

Low and medium-rate applications require a single layer of connectors. Some high & ultra high applications will require more than 1 layer of connectors.

Step 4. Determine Connector Part Number

Refer to connector selection sketch on page 22, for the appropriate battery configuration. Note that for typical 1-row bookshelf rack configurations, connection number 2 in the connector selection sketch is the standard connector used.

For the example of the M12V90s mentioned above, the correct connector selection would be number 2. The part number for this connector is:

L03-109210-034

Note: For a two-row system, an inter-row connector bar is also required. This is selected from the same table and is typically connection number 3.

5. Determine Connector Cover Requirements

Connector covers for the M12V90s are located in the “CONNECTOR BAR COVERS” table and correspond to the connection number (CONN #). For this example, the correct connector cover would be number 2. The part number for this connector cover is:

L14-401130

The quantity of connector covers should match the number of connectors.

Step 6. Determine Cable Kit Requirements

If a cable kit is required, (tier to tier connection only) refer to the “CABLE KITS” table. Cable kits are available for low and medium rates for Marathon. High and ultra-high rate cable kits are available for Sprinter products. The standard length is 36”. Cross aisle cables are not available.

For this example, a cable kit is not required.

Step 7. Determine Terminal Kit Requirements

If more than one cable will be attached to a post, a terminal plate kit will be required.

For this example, it is assumed that the installation uses 2 runs of cable from the rectifier to the battery terminal. This would require a terminal kit. From the “MARATHON M12V90(F) ACCESSORIES AND RACKS” Sheet, the correct part number for the terminal kit is:

K17-MSBTP

Step 8. Determine Lug Insulator Requirements

If a cable lug insulator is required, the part number can be found on the same page and is:

L14-LUGBOOT

Step 9. Determine Grease & Number Requirements

If grease and cell numbers are required refer to the “CELL NUMERALS & GREASE” table. For this example of four (4) M12V90 units, the correct part number is:

K17-418291S

Step 10. Determine Handle Requirements

To determine the number of handles required, use the following formula:

$$\text{Handle qty.} = \text{Units}/5$$

Refer to the appropriate battery accessories and racks sheet for the correct P/N. For this example, the correct part number is:

K01-M12V90

The correct number of handles to order is:

$$\begin{aligned}\text{Handle qty.} &= 4/5 \\ &= 1\end{aligned}$$

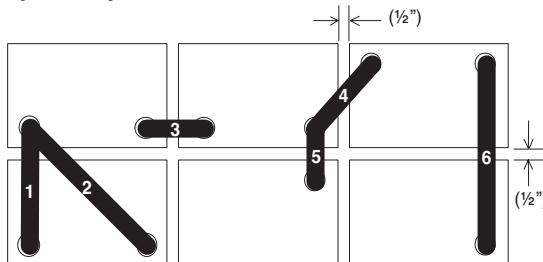

Step 11. System Summary

For the example of four (4) Marathon M12V90 batteries, the following line items would make up the system:

Line Item	Description	Part #	Qty
1	Battery	M12V90F	4
2	Rack	GNB114S370Z0	1
3	Connectors	L03-109210-034	3
4	Connector Covers	L14-401130	3
5	Cable Kit	N/A	0
6	Terminal Kit	K17-MSBTP	1
7	Lug Insulator	L14-LUGBOOT	0
8	Cell Numbers & Grease	K17-418291S	1
9	Handles	K01-M12V90	1

The diagram illustrates the side profile of a vehicle. A vertical dimension line indicates a total height of 10.45 inches. A horizontal dimension line, labeled "B" and "Battery Clearance", shows the distance from the bottom of the vehicle to the top of the battery compartment.

Top View Side And End Restraints Included
For Seismic Racks Only

The diagram illustrates a plastic rail cover with a total height of 85.00 inches, divided into five tiers. The top tier is labeled "5 Tier Rack Height". Below it, four more tiers are labeled "4 Tier Rack Height", "3 Tier Rack Height", "2 Tier Rack Height", and "1 Tier Rack Height". The bottom section of the cover has a height of 17.00 inches, with two sections of 8.93 inches each. The overall width of the cover is 124.3 inches, as indicated by the dimension line on the right.

GNB Industrial Power – The Industry Leader.

ABSOLYTE® **GNB Flooded CLASSIC**®

MARATHON®

ONYX™
LITHIUM POWER

RELAY GEL®

Sonnenschein

Sprinter®

GNB Industrial Power, a division of Exide technologies, is a global leader in network power applications including communication/data networks, UPS systems for computers and control systems, electrical power generation and distribution systems, as well as a wide range of other industrial standby power applications. With a strong manufacturing base in both North America and Europe and a truly global reach (operations in more than 80 countries) in sales and service, GNB Industrial Power is best positioned to satisfy your back up power needs locally as well as all over the world.

Based on over 100 years of technological innovation the Network Power group leads the industry with the most recognized global brands such as ABSOLYTE®, GNB® FLOODED CLASSIC®, MARATHON®, ONYX™, RELAY GEL®, SONNENSCHEIN®, and SPRINTER®. They have come to symbolize quality, reliability, performance and excellence in all the markets served.

GNB Industrial Power takes pride in its commitment to a better environment. Its Total Battery Management program, an integrated approach to manufacturing, distributing and recycling of lead acid batteries, has been developed to ensure a safe and responsible life cycle for all of its products.
